Note: Nominal Specs represent the design specs: all units should be able to approximate these—some will exceed and some may drop slightly below these specs. Limit Specs represent the absolute worst condition that still might be considered acceptable: in no case should a unit perform to less than any limit spec.

BLOCK DIAGRAM

PRINCIPLES OF OPERATION

The PRO-34 is a PLL (Phase Locked Loop) synthesized VHF/UHF FM receiver, controlled by a CPU (central processing unit) via a keyboard.

The VHF Lo band (30~54 MHz) or VHF Hi band (136.005~174 MHz) is received in 5 kHz increments and the UHF Lo band (380~512 MHz) or UHF Hi band (806~960 MHz) is set up to be 12.5 kHz increments. Similarly, the aircraft band (108~136 MHz) is in a 25 kHz step.

All functions such as receiving frequency range, frequency determination, scanning and delay time etc. are controlled by the CPU. The CPU is able to do only the assigned functions, and no modification of the CPU is feasible.

The following paragraphs explain the operation of the circuit in terms of the functional blocks:

A varactor (variable capacitance diode) tuning ("Automatic Tuning System") is employed on all Bands.

Field-effect transistors (FET) are used in the RF/MIX circuits of low and high Bands, to achieve optimum mix-modulation and mutual-modulation characteristics. Q109 amplifies the 10.7 MHz IF. A 10.7 MHz monolithic crystal filter is incorporated to obtain a good IF selectivity.

IC101 contains the local oscillator, mixer, IF amplifier, quadrature FM detector and noise amplifier. A crystal oscillator produces 10.245 MHz which is mixed with 10.7 MHz, resulting in 455 kHz IF. A 455 kHz ceramic filter is provided to increase the IF selectivity. The 455 kHz IF signal is amplified in the IF amp stage, and the quadrature FM detector detects it to an audio signal.

The detected output of the FM is applied to IC9. IC9 amplifies the audio signals and drives the speaker.

IC1 is the CPU. The CPU does data processing, calculation etc. Any unstable supply voltage (V_{DD}) to the CPU can cause the CPU to get mal-functioned, such as wrong data processing, wrong data transfer etc. To overcome this, C2 and R13 in the logic circuit "initialize" the CPU. (Refer to the logic section schematic on page 60.)

The initialization is done as soon as batteries or external power is connected. Figure A shows the initializing waveform. Memory backup function is automatically started whenever the initialization has been done and then functions in approximately 1 hour after the batteries or external power is disconnected.

The RESET switch is located in the hole on the bottom of the battery compartment and is used to correct an LCD or keyboard mal-function.

The unit has battery-saving control circuit in manual mode. When the unit is in operation, the pin 74 of IC1 (CPU) is "H" and Q3 is ON. If no signal input or no key input existed more than 5 seconds in manual mode with the SQUELCH on, the pin 74 becomes "L" (Fig. B) and Q3 turns off then the power supply for most of circuit is shut down (except CPU and Audio circuit). In this battery-saving mode, 40% of the power can be saved during normal operation.

The initialization of the CPU, mentioned above can also be done by pushing RESET switch. Figure A shows the rise time duration when the initialization is done.

CX1 (2 MHz) is a ceramic oscillator clock which is used for CPU control. Figure C shows 1/8 divided waveform of Figure D.

GENERAL OPERATION OUTLINE

*1

Enter the desired frequency in each channel as follows:

Enter the desired frequency with numeral keys.

Press **ENTER** to memorize the frequency.
If wrong frequency (out of the band) is entered, "ERROR" will be displayed.
Press **CLEAR**, then enter the correct frequency.

Press **PGM** to advance to next channel.
Enter the frequency and press **ENTER**.
Repeat it to memorize frequencies one by one.

Press **PRI** so that priority channel appears.

To revert to the previous channel, press **PRI** again.

Press numeral keys (1 through 200) and then press **PRI**.
Priority channel will be changed to newly entered channel.

To call monitor channels, press **MON**.

Press **MON** so that next monitor channel appears.

To call the monitor channels directly, press numeral keys.

To revert to the previous channel, press **PGM**.

KEY LOCK switch ON. All keys unoperate except REMOTE KEY (SCAN, MAN).

*2

Enter search frequency as follows.

Press **LIMIT** and enter the lower frequency of the range to search with numeral keys.

Press **ENTER**.

Press **LIMIT** and enter the upper frequency of the range to search.

Press **ENTER**.

Press **▲** to search from lower frequency.
Press **▼** to search from upper frequency (squench must be on).

Press **MON** to store the desired frequency (10 monitor channels) in the search mode.

To start search, press **▲** or **▼**.

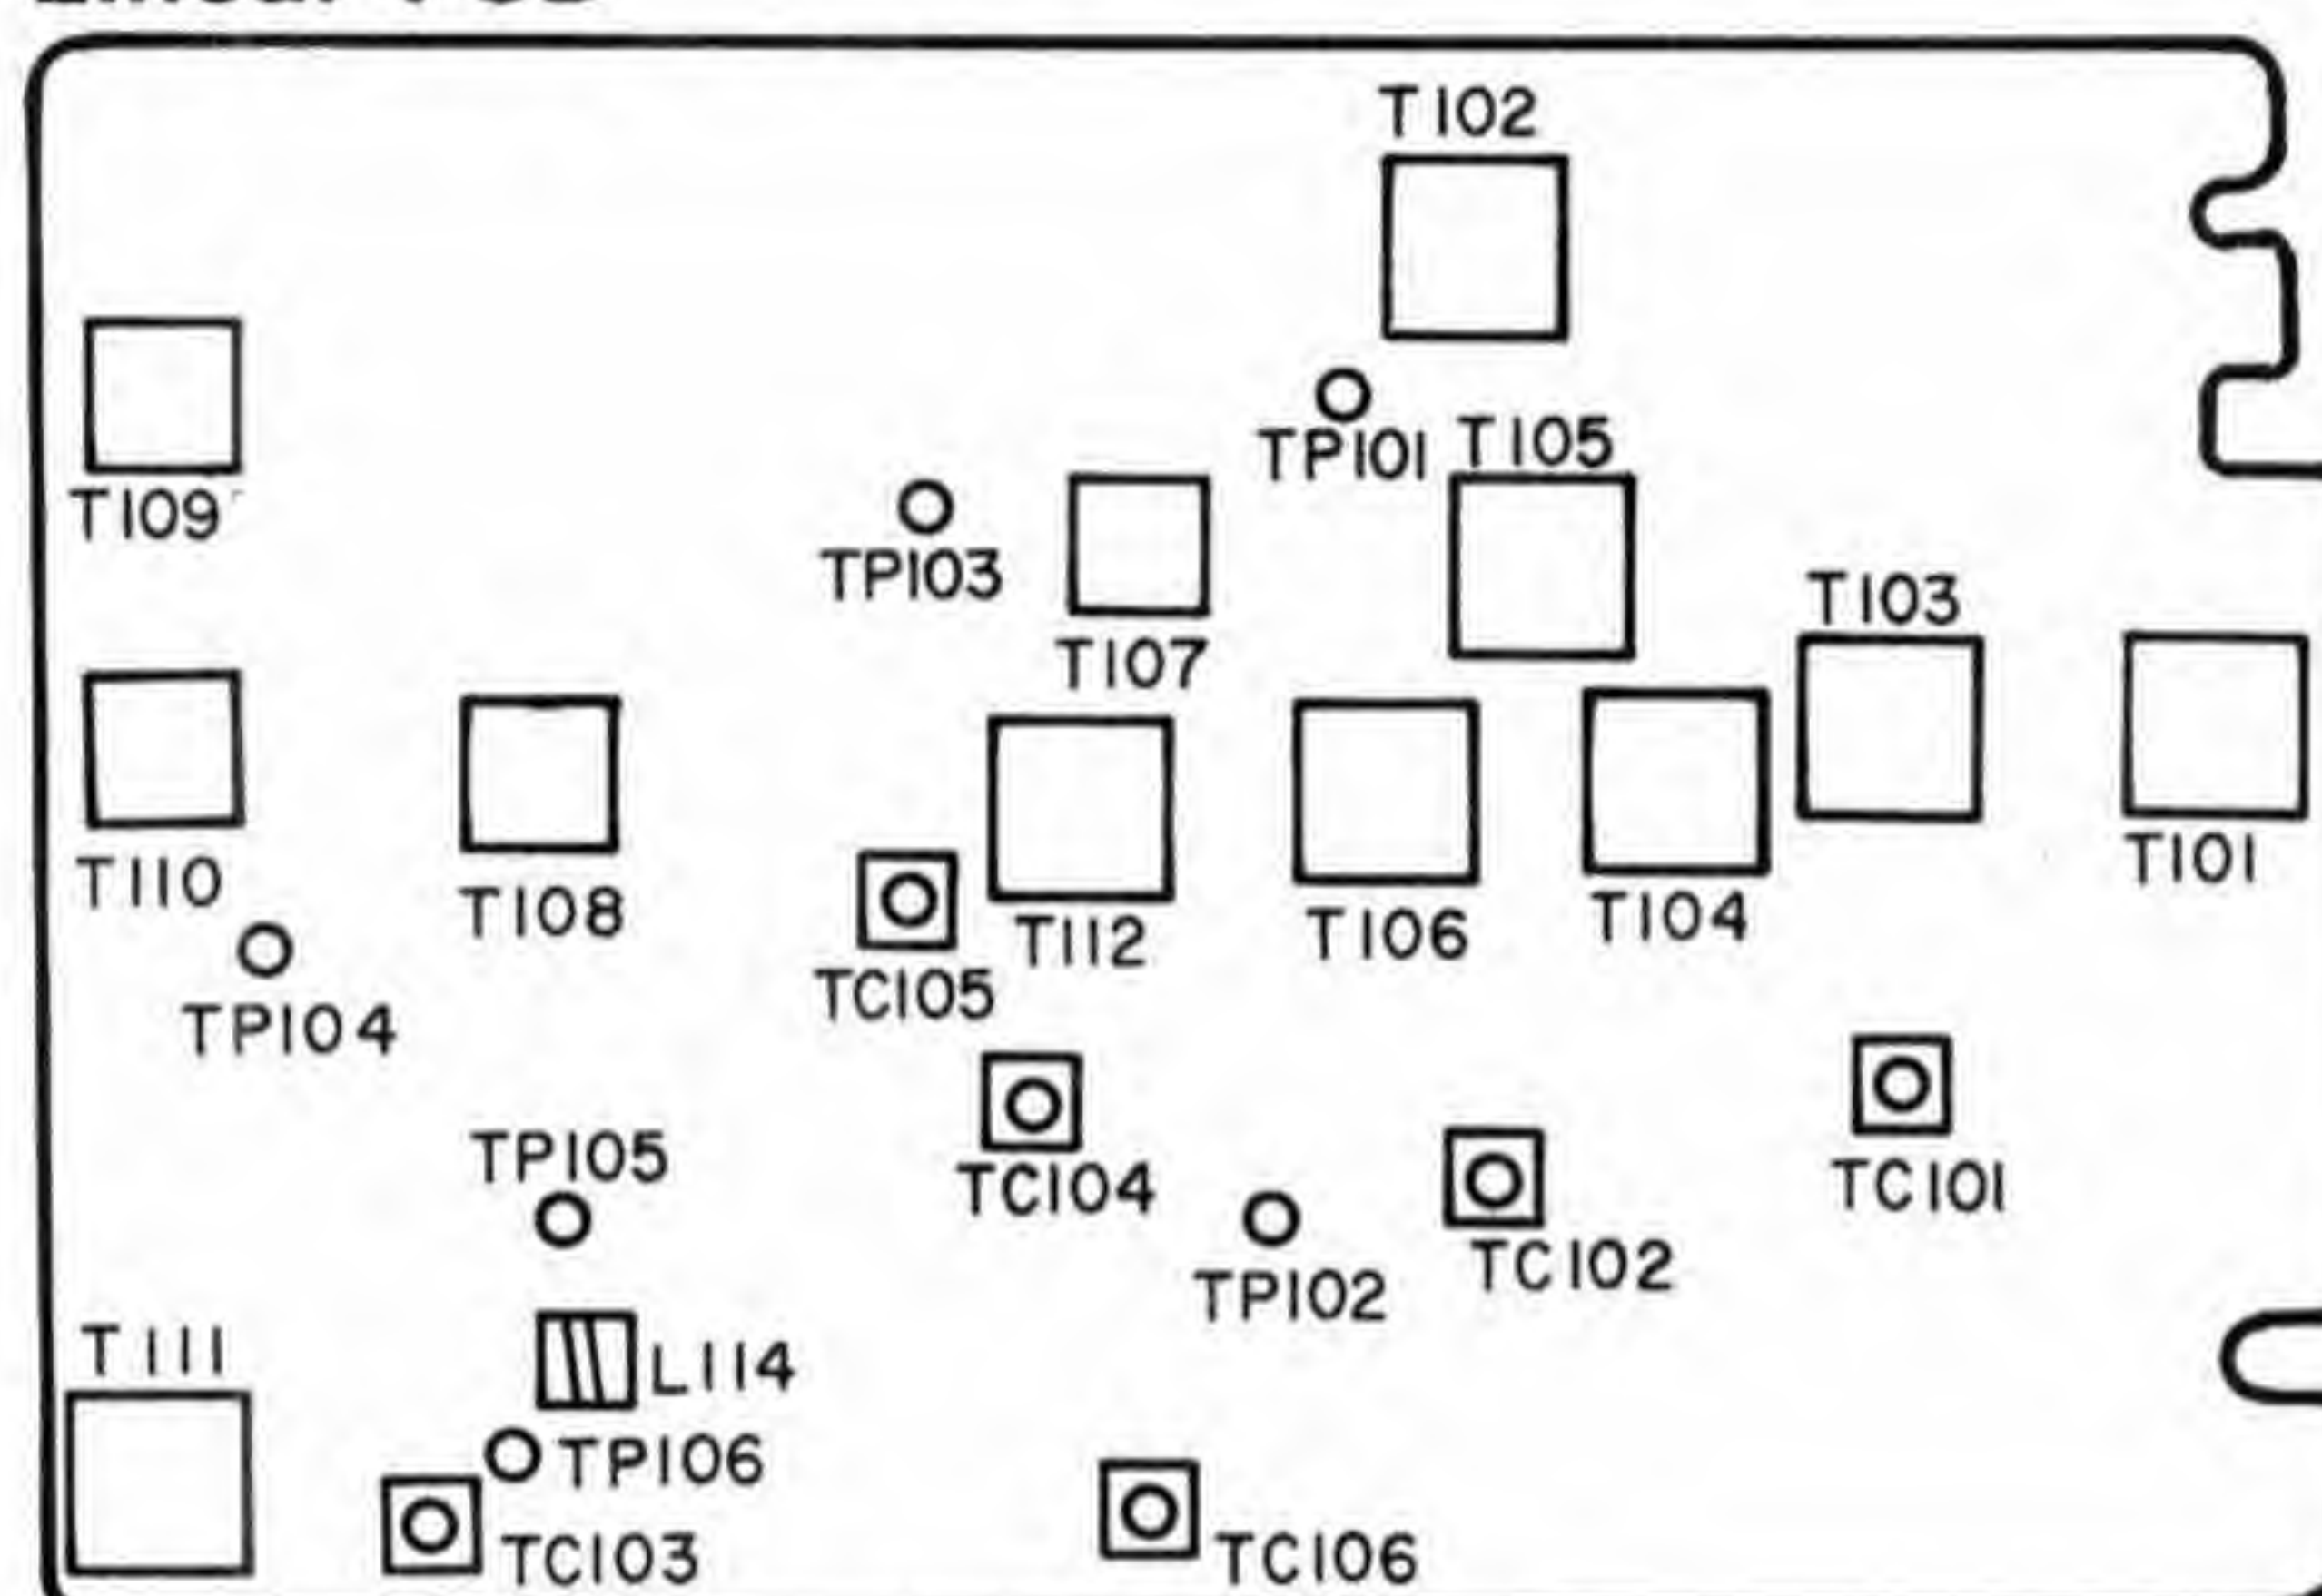

ALIGNMENT/ADJUSTMENT

Alignment and Test Point Locations

Logic PCB

Linear PCB

Alignment Preparation

Test equipment required

1. Oscilloscope (0~500 kHz, 0~50 MHz)
2. AC SSVM
3. DC SSVM
4. Frequency Counter (200 MHz)
5. 8-ohm dummy load
6. Slow Sweep Generator with variable marker (10.7 MHz)
7. VHF Sweep Generator with variable marker (30~54 MHz, 136.005~174 MHz)
8. UHF Sweep Generator with variable marker (380~512 MHz)
9. FM Signal Generator (30~54 MHz, 136.005~174 MHz, 380~512 MHz, 806~960 MHz)

Notes:

- Use non-metallic tuning tools.
- The test equipment and receiver should be warmed up at least 10 minutes before proceeding to alignment.
- The signal level from the generator should be kept as low as possible to obtain the usable output.
- 6 AA batteries are required to hold the memory when the external power is disconnected. Always be sure the batteries are fresh. If the low-battery indicator lights, replace the batteries, or the pre-programmed channel memories will be lost (and will have to be re-programmed).

The memory backup circuit can hold the programmed channel memories for about one hour even when neither the batteries nor the external power is provided.

Program CH1 to CH15 as follows.

Channel	Frequency(MHz)	Channel	Frequency(MHz)
1	30.0000	9	174.0000
2	41.0050	10	380.0000
3	54.0000	11	451.0000
4	108.0000	12	512.0000
5	121.0000	13	806.0000
6	136.0000	14	860.0000
7	136.0050	15	960.0000
8	155.0000

12	OFF/VOLUME Control: ON SQUELCH CONTROL:CCW Select channel 13.	Same as step 10.	T106	Adjust TC106 for maximum sensitivity.

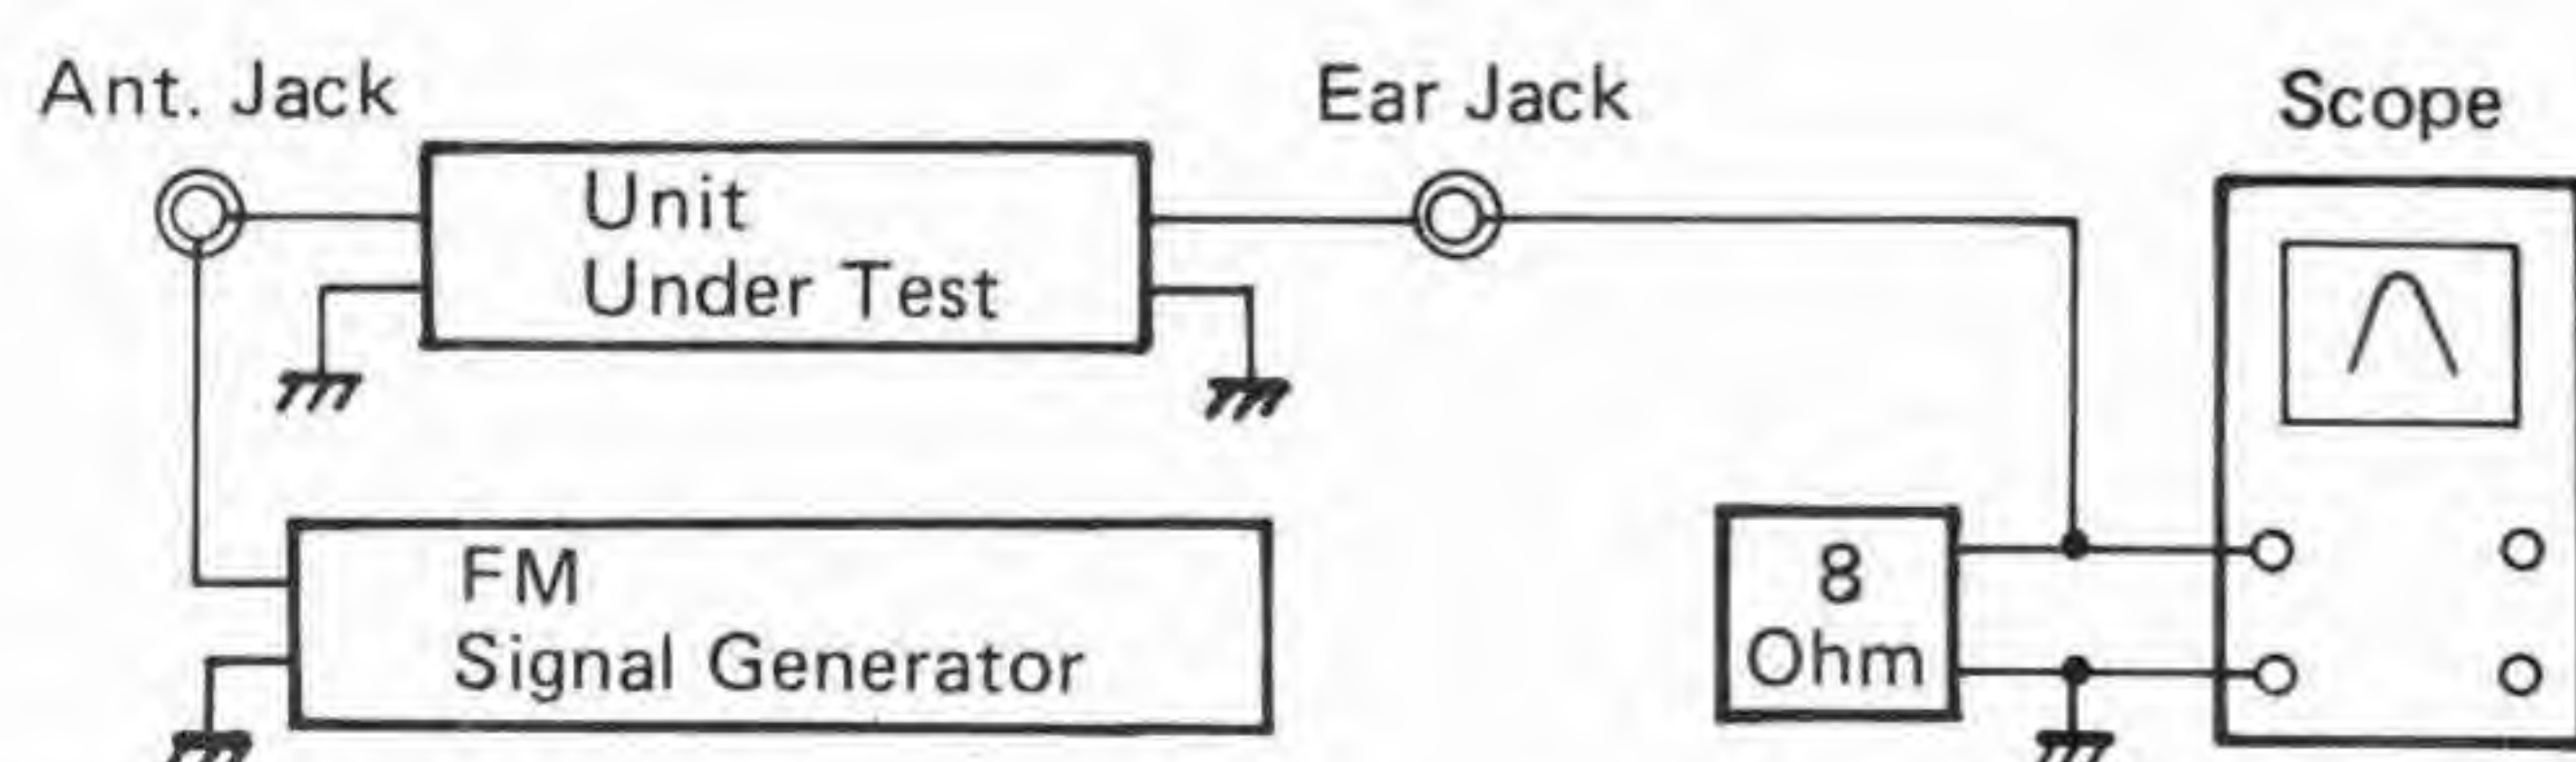

Figure 8

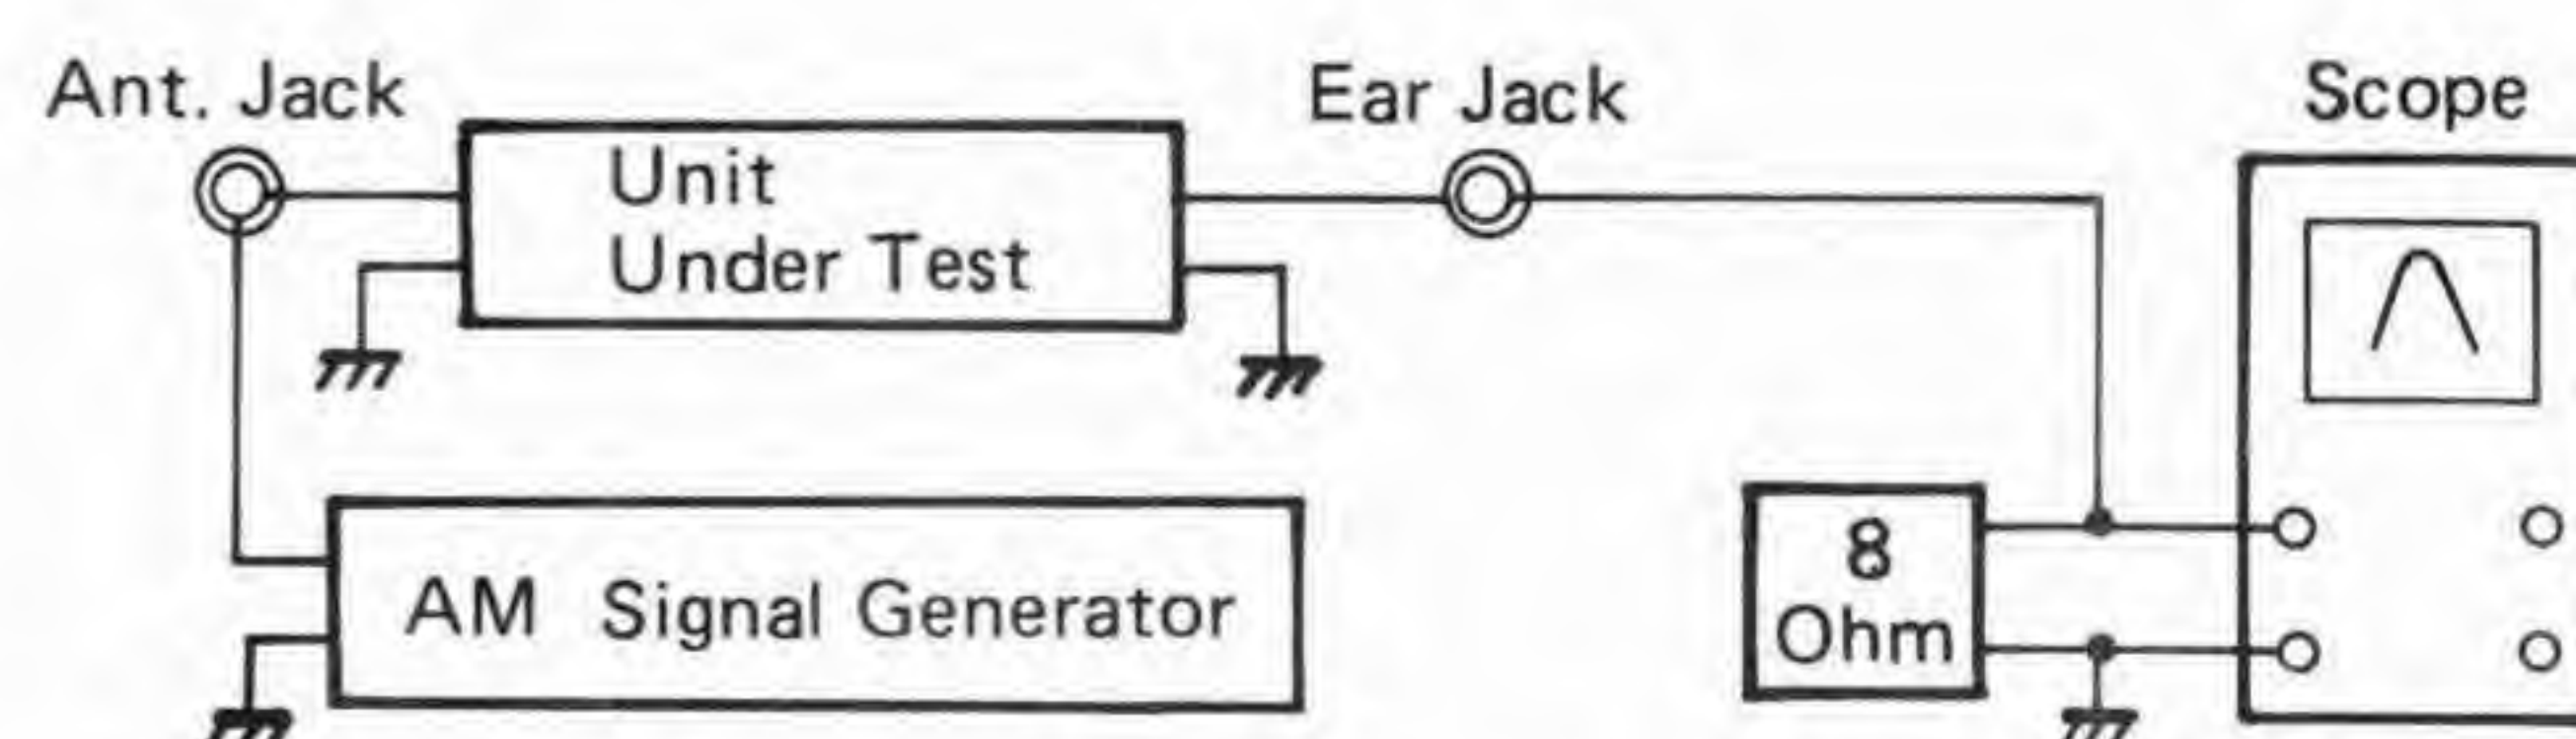

Figure 9

Step	Control Setting	Test Instrument Connection	Remarks
13	OFF/VOLUME Control: ON SQUELCH Control: CCW Channel as Table 1.	Connect FM signal generator to the ANT jack and AC SSVM to EAR jack across 8 ohm dummy load. Set the signal generator to each frequency as Table 1. Set the VOLUME control for 0 dB (0.775 V) reading on the SSVM.	Turn off the modulation and measure the (S+N)/N ratio.

Note:
TP104 is used to observe the AM band detection output.

Zeromatic Function Test Procedure

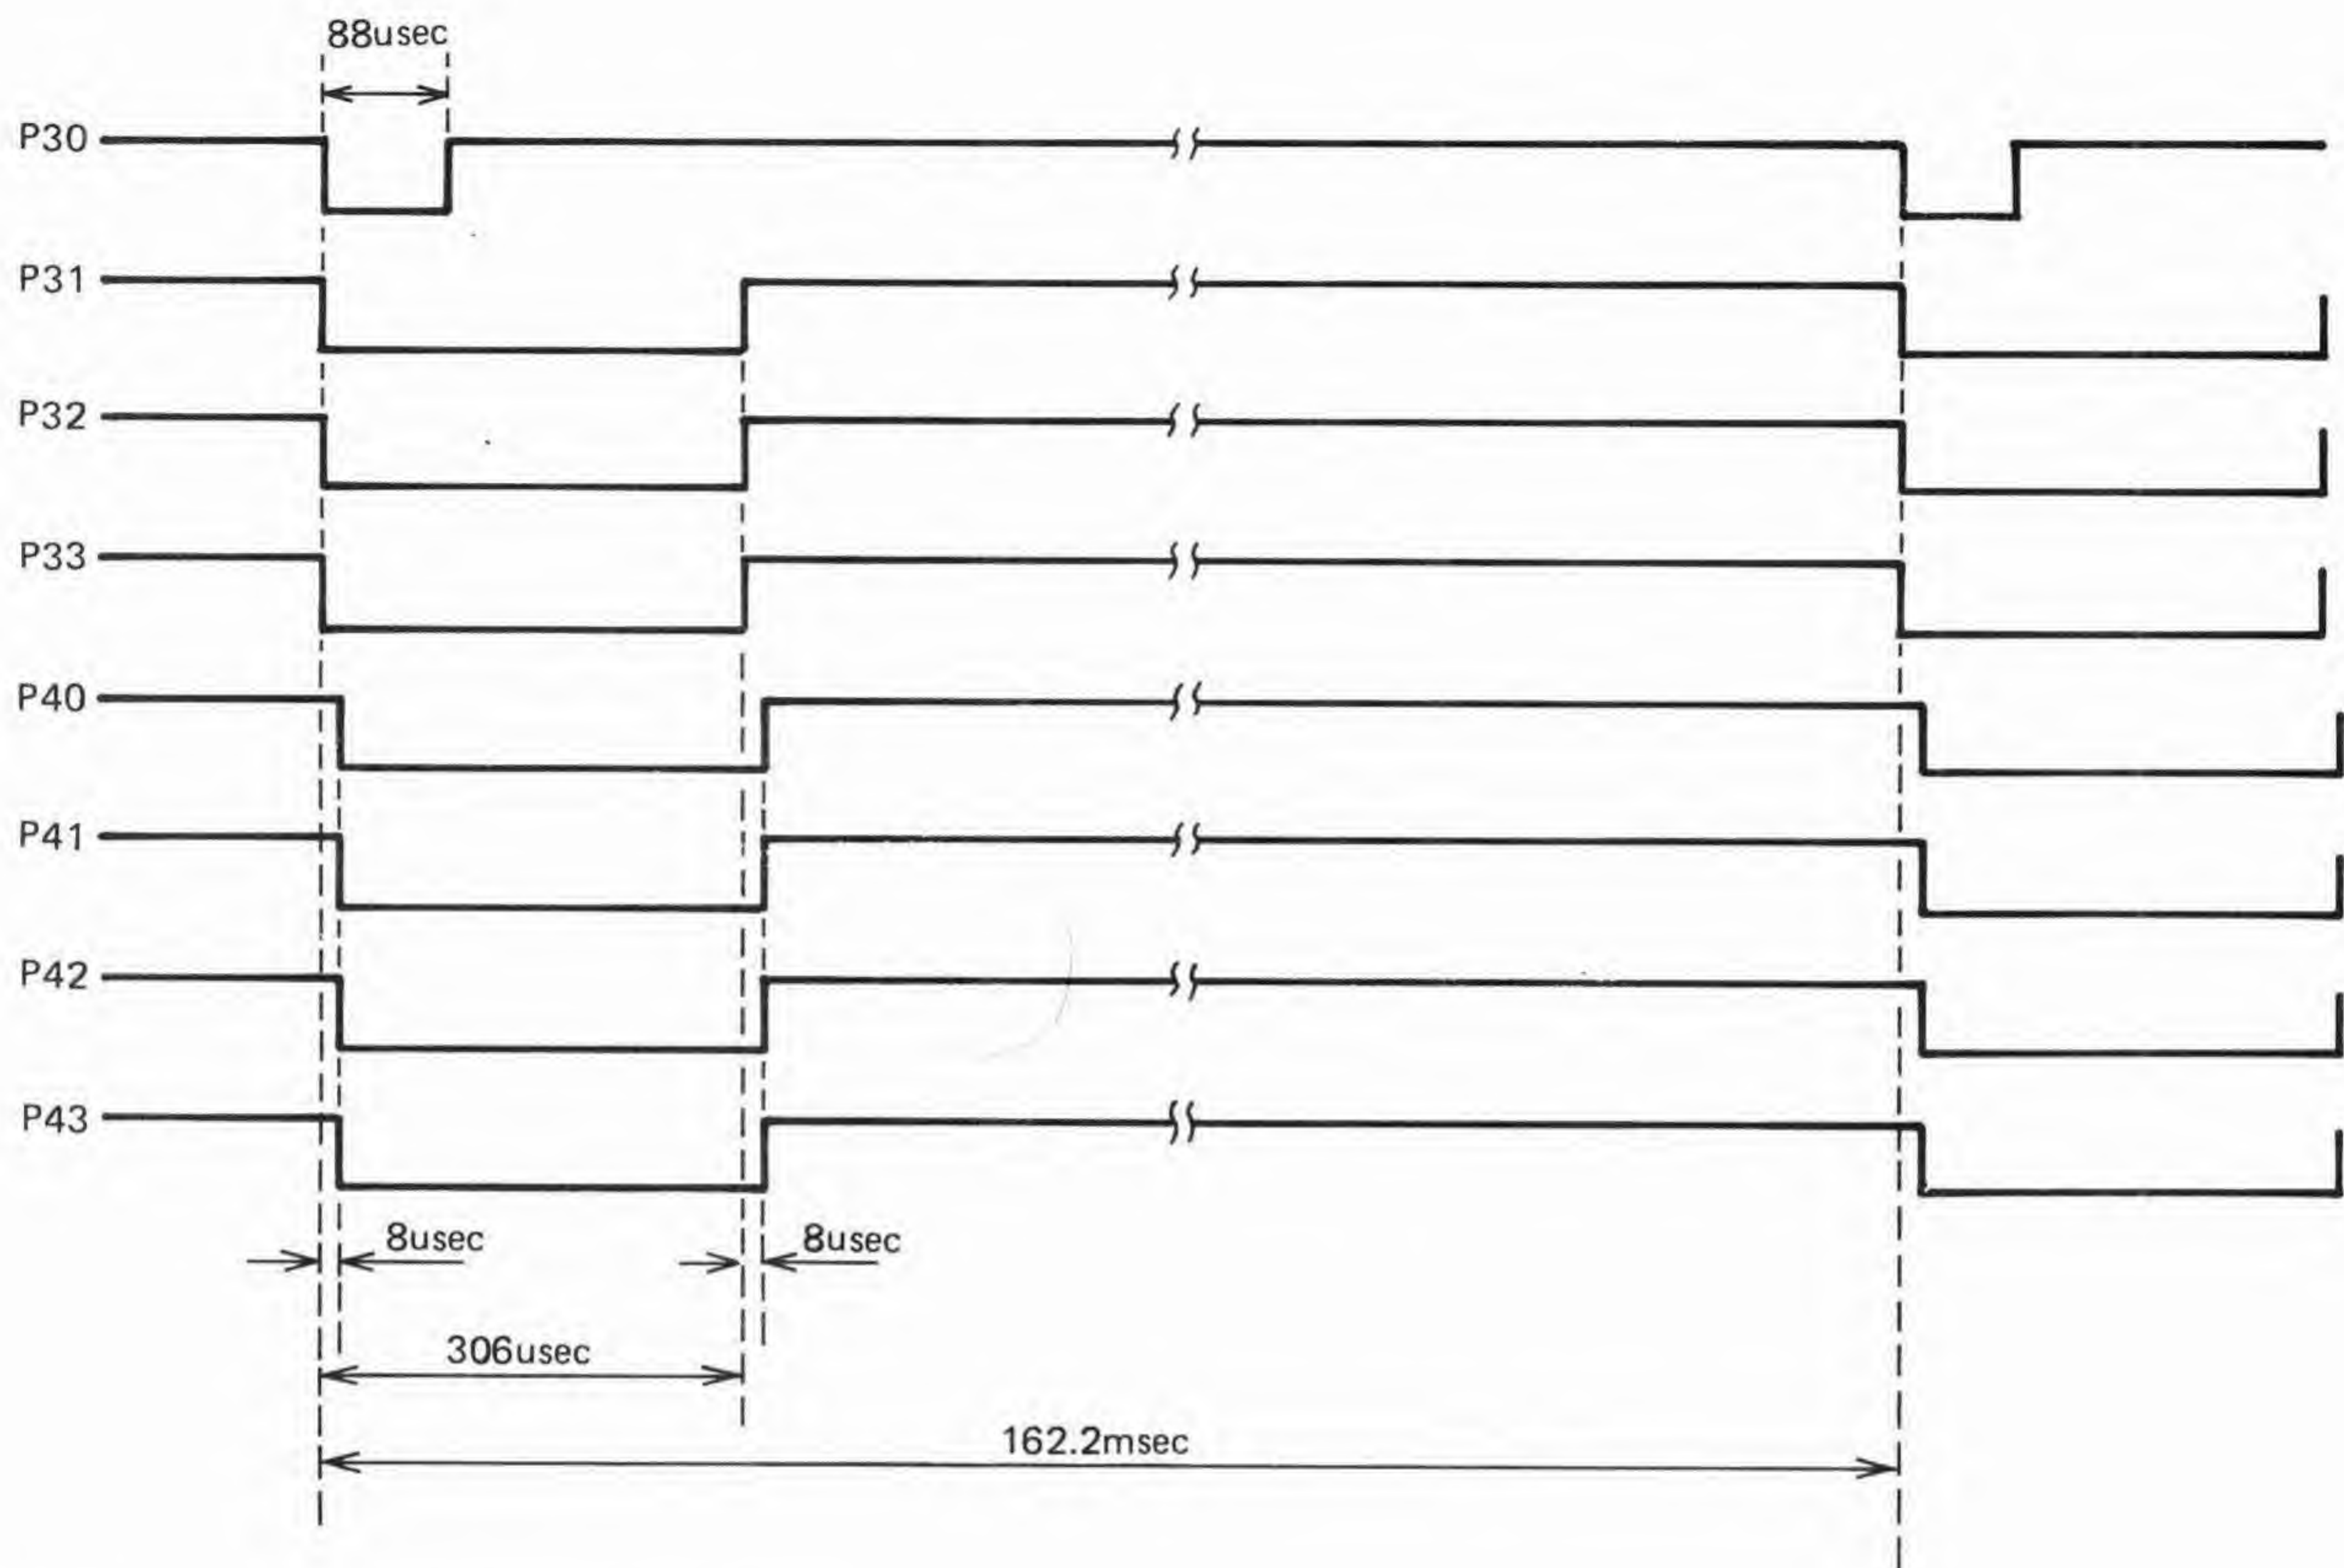

(Zeromatic functions when OUTPUT is in “L” level.)

	$0 < e_1 < e_3$	$e_3 < e_1 < e_2$	$e_2 < e_1 < V_{CC}$
OUTPUT (IC4 Pin No.8)	H	L	H

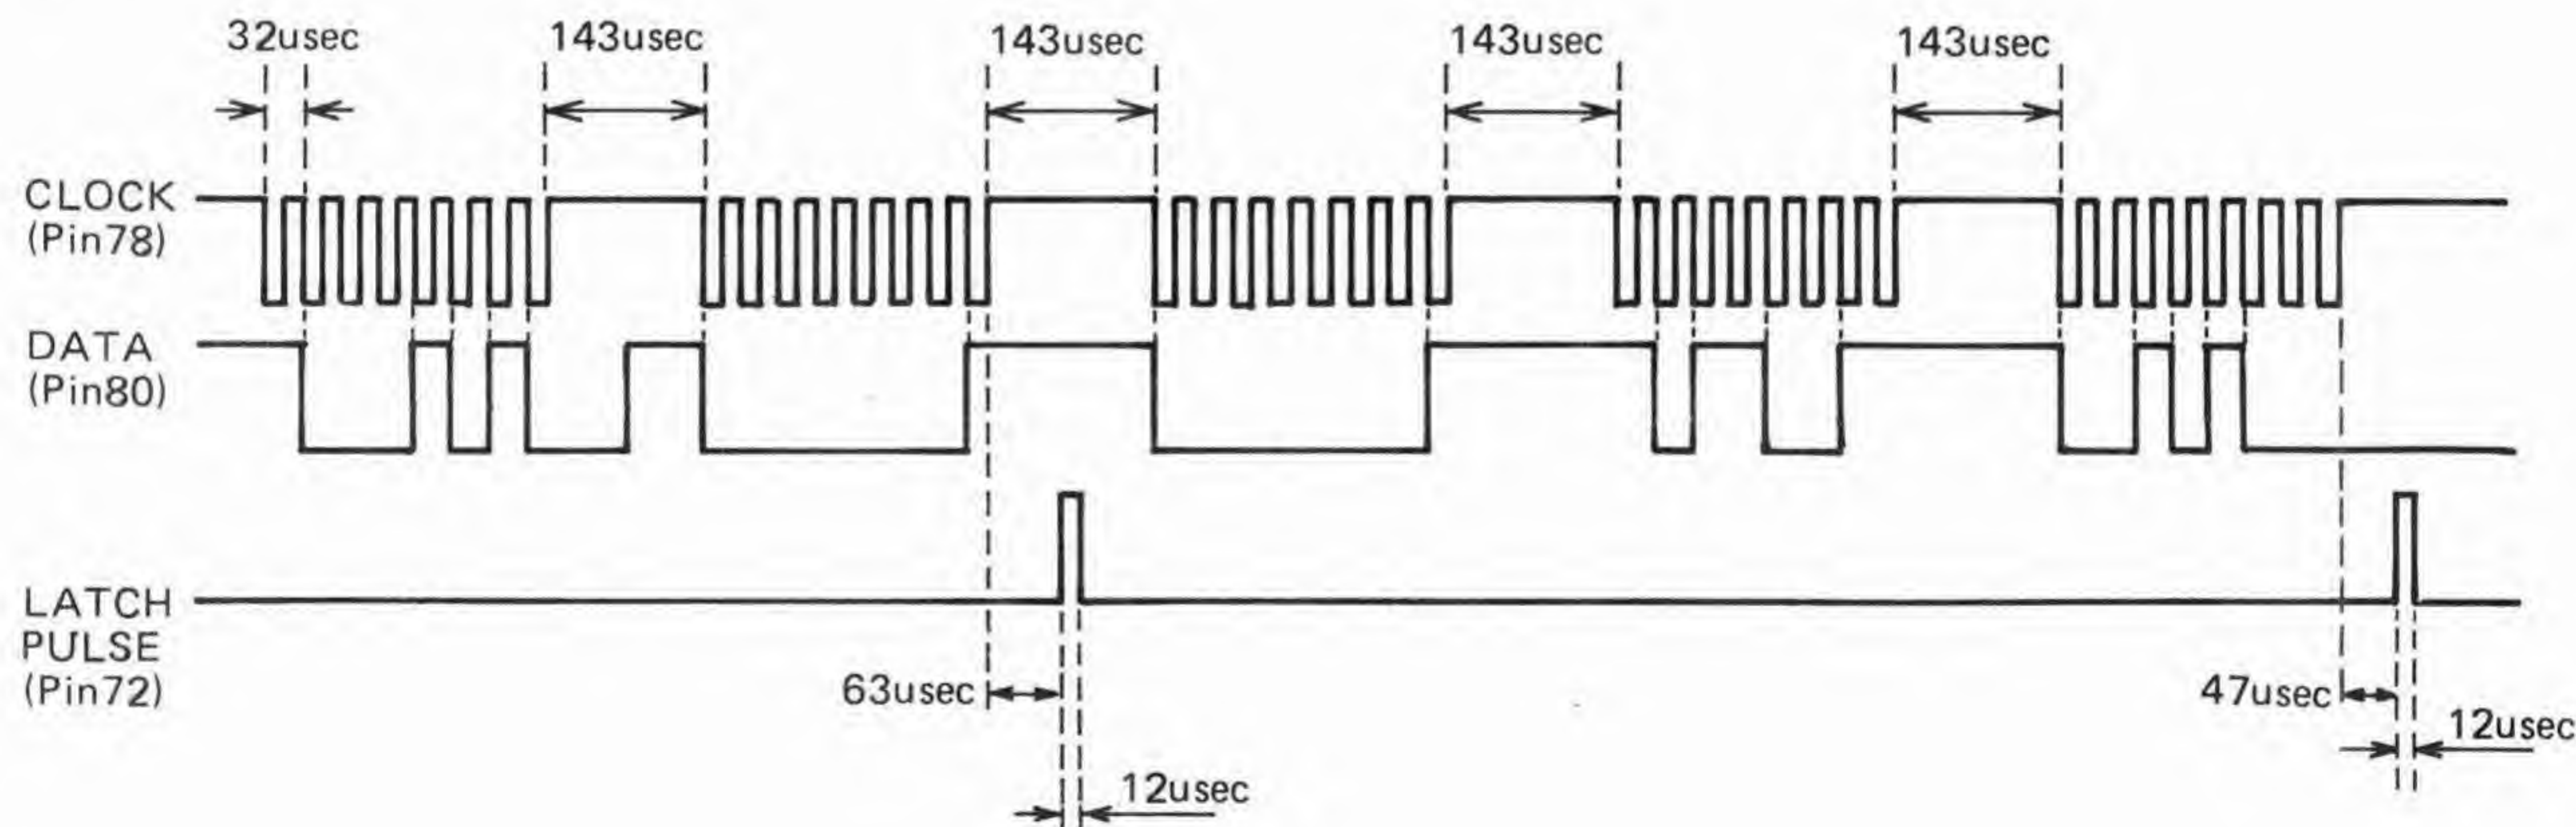

To adjust the e_1 voltage, receive a signal in the manual mode, and set T103 to obtain 2.7 V (1/2 V_{CC}) at TP-103. It is convenient to use the National Weather Service Signal for the adjustment. In the event of Zeromatic not functioning correctly, refer to “Reference Frequency OSC Alignment” (page 10), and check 118.700000 MHz \pm 10 Hz, and adjust T103 again to 2.7 V DC while a signal is being received.

Key Access Pulse Output (IC1)

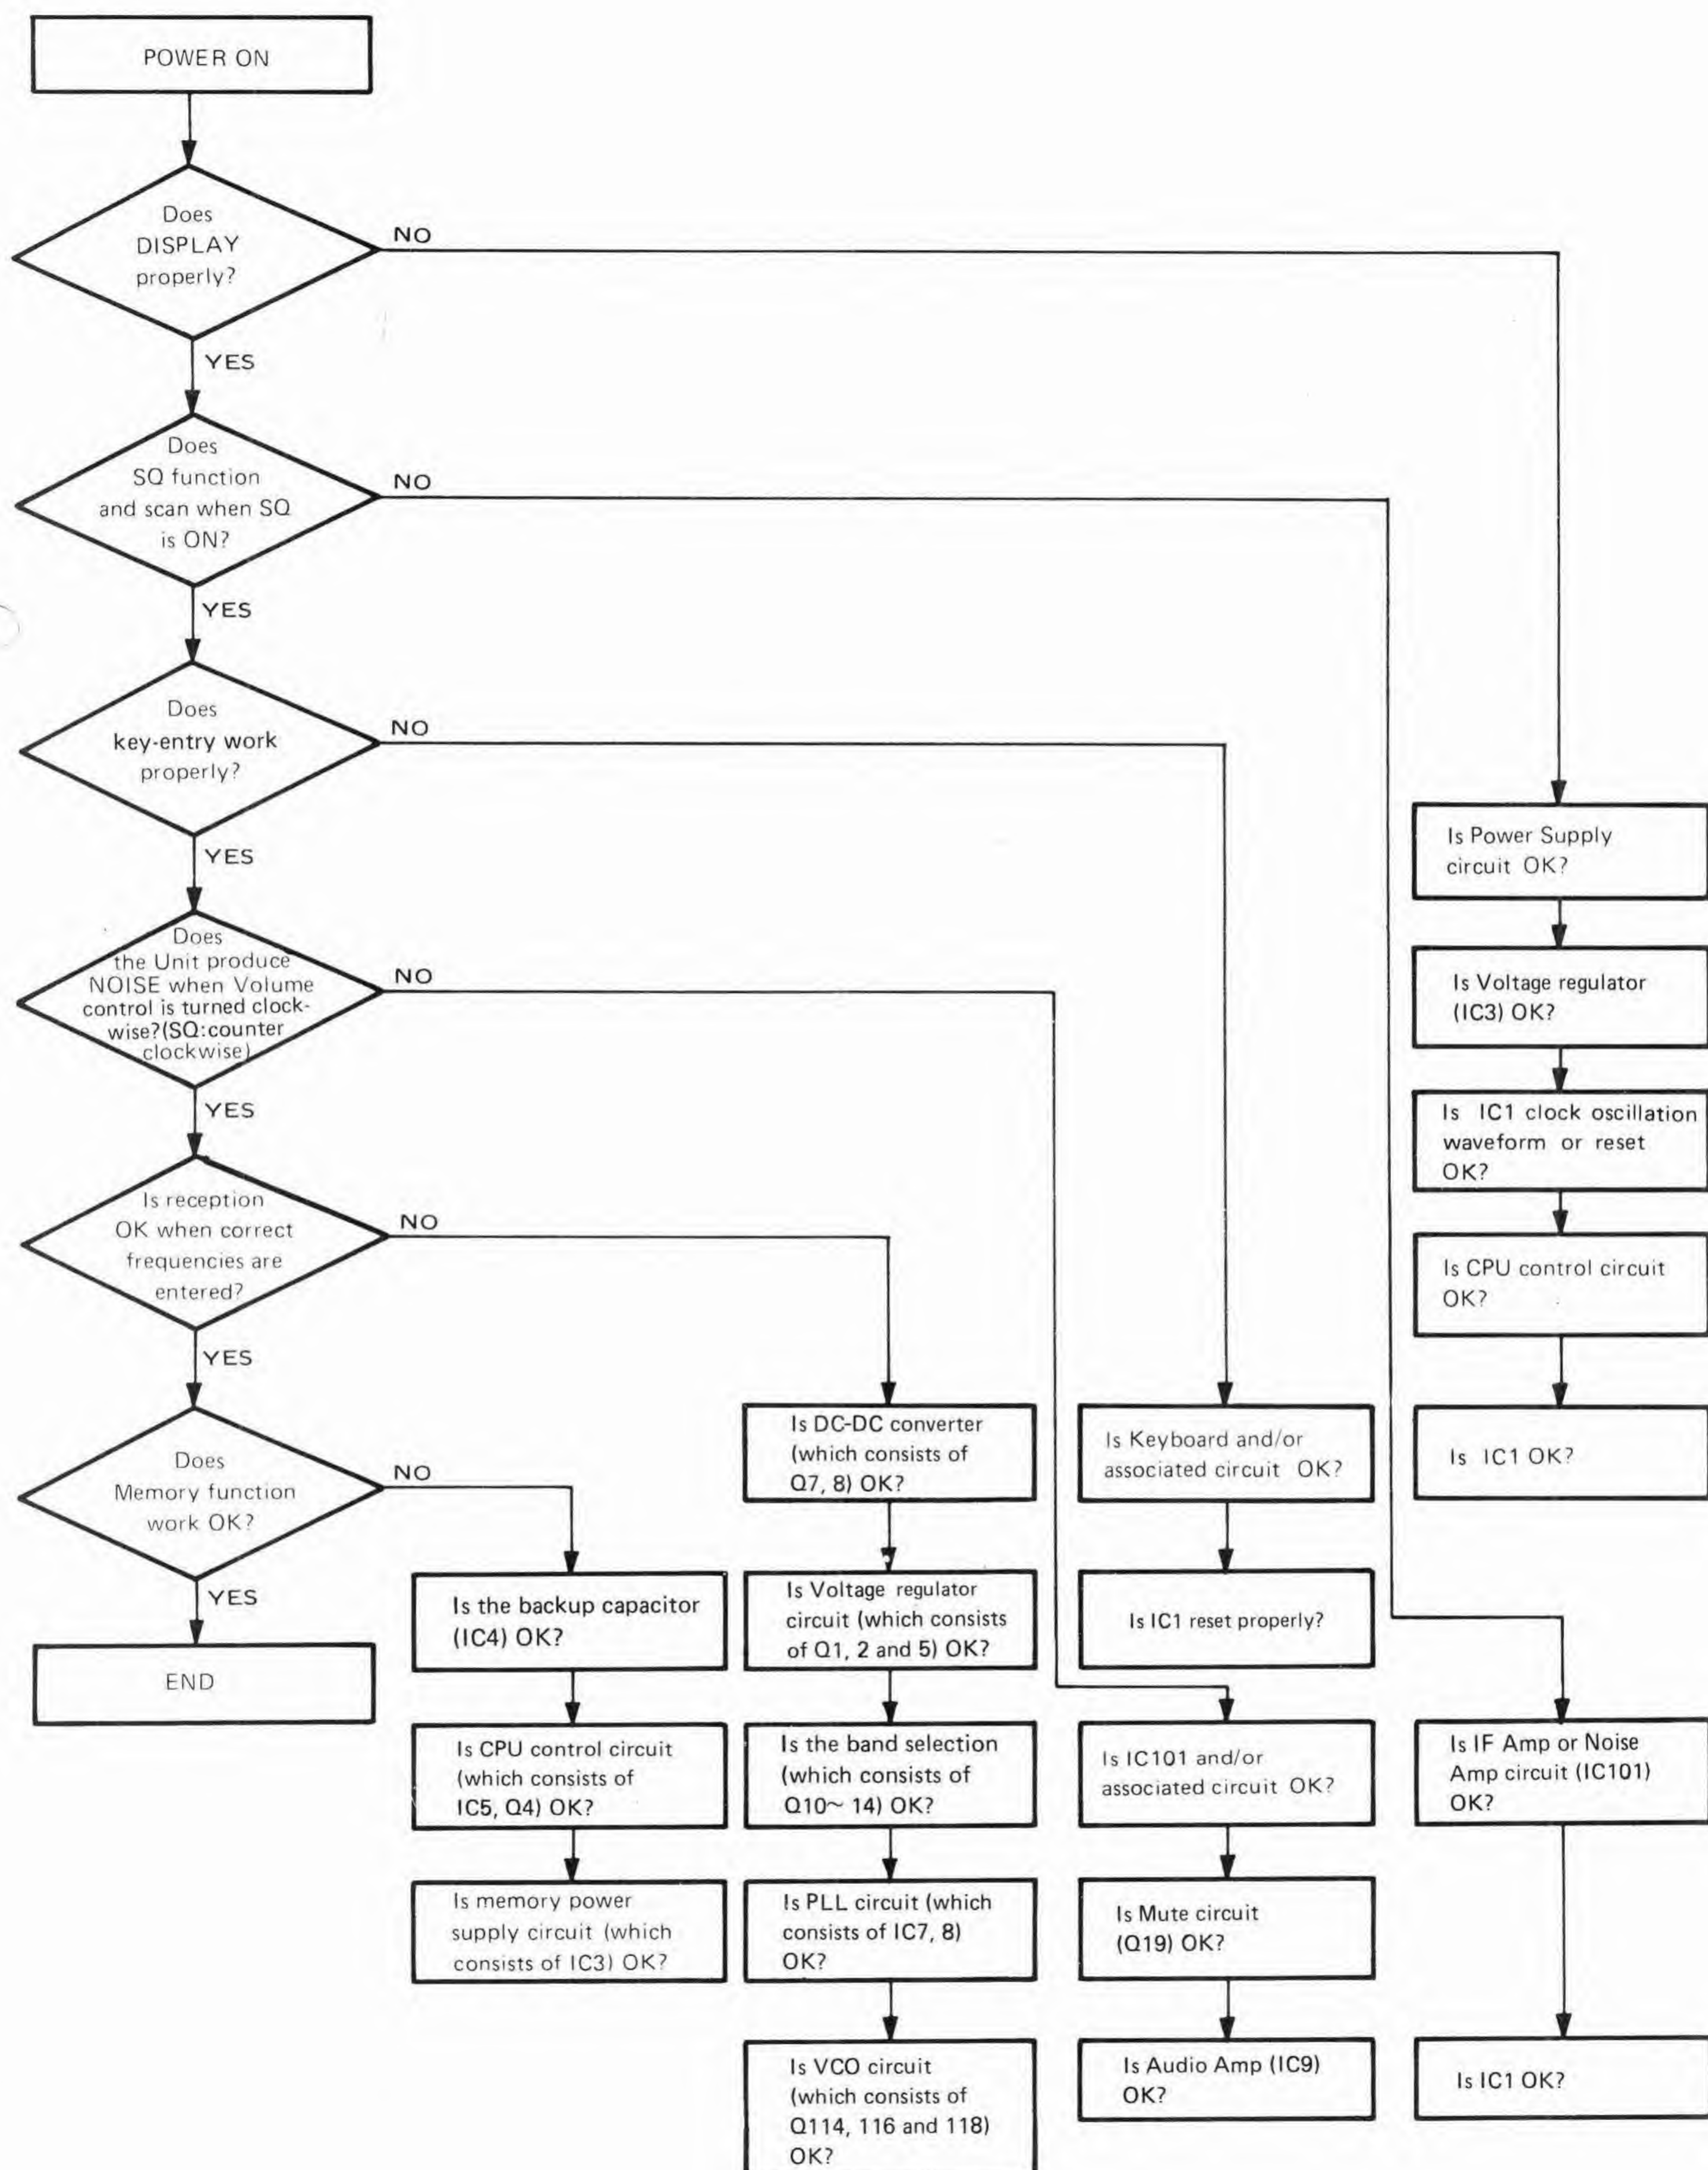

Note:
Set KEY-LOCK SW to OFF, and do not push any key in the Program Mode.

PLL Data Waveform (IC1)

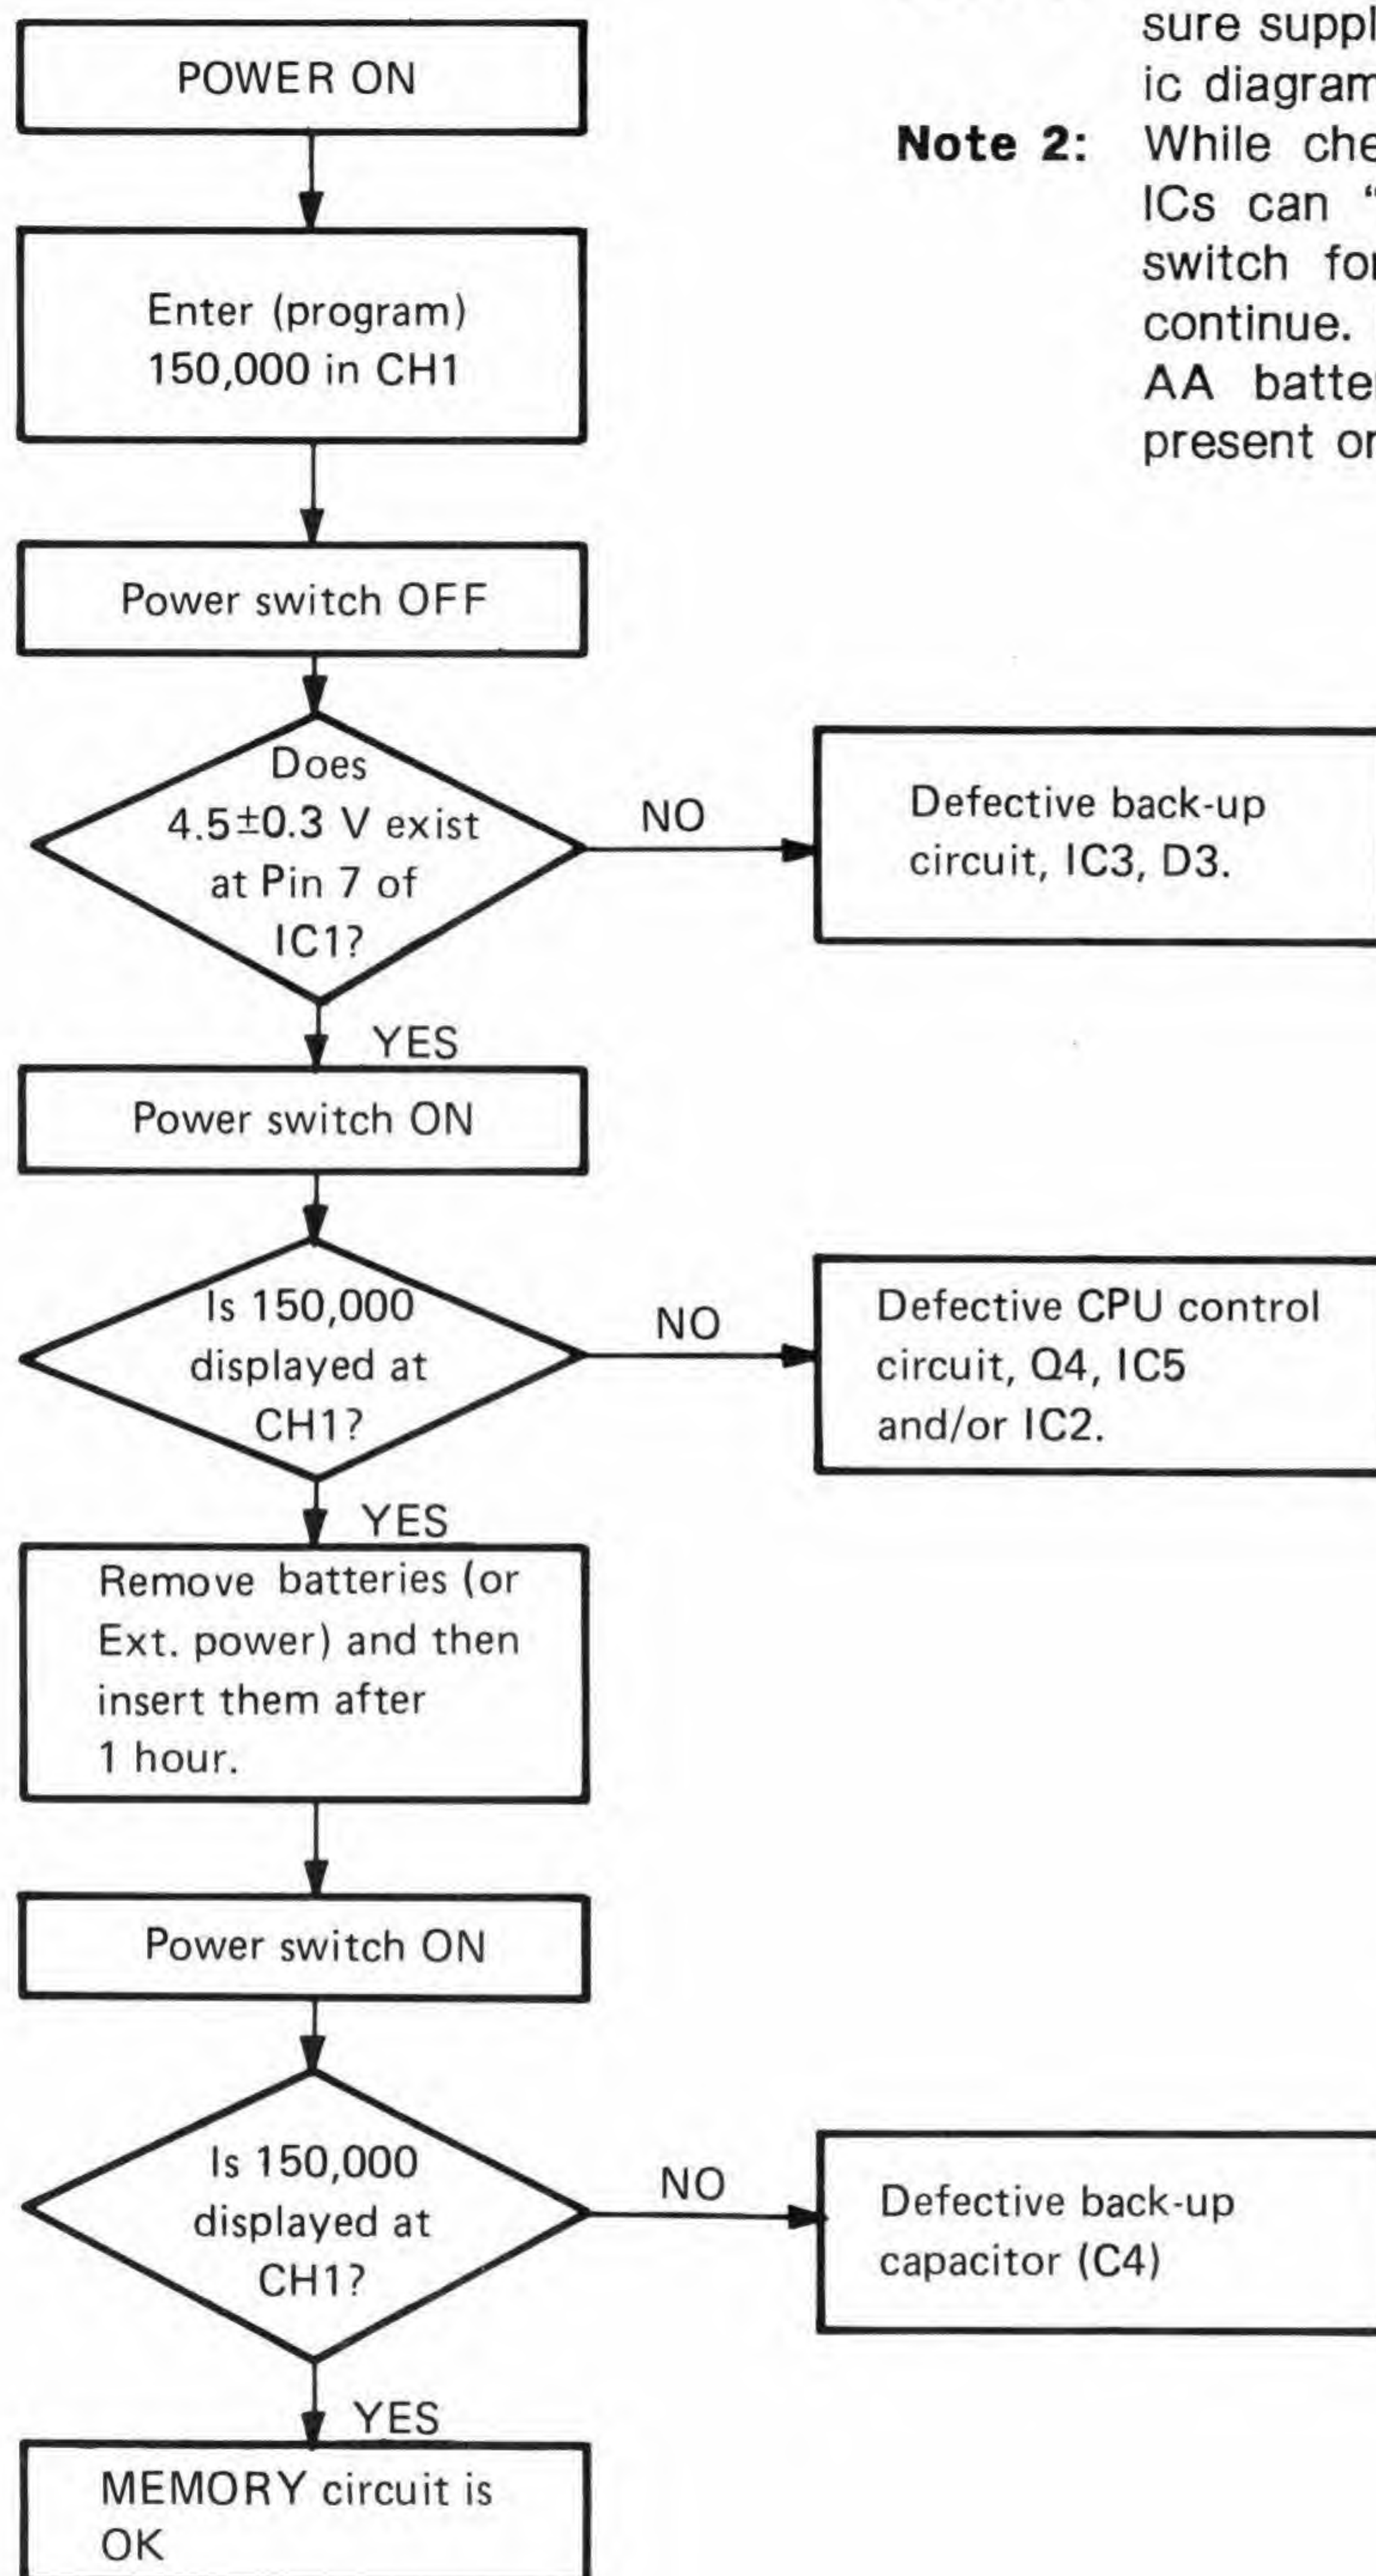

Note:
Enter 150.0000 MHz to channel 1 and lock out other channels.
Observe the waveform while scanning.

Reception Check

Memory Check

Note 1: Prior to checking the CPU System, measure supply voltage to ICs. (See schematic diagram.)

Note 2: While checking the following items, the ICs can "latch up." If so, push RESET switch for about one second and then continue. Be sure that either the built-in AA batteries or the external power is present on this check.

TROUBLESHOOTING

Symptom	Cause/Remedy
1) Display does not light and no sound when POWER is on. Volume control: MAX. Squelch control: counterclockwise (CCW)	1) Defective batteries: Change batteries. 2) Wrong polarity of batteries: Correct the polarity of batteries. 3) Defective external power jack or charge jack: Replace. 4) Defective ON—OFF switch on volume control: Replace.
2) Display lights but no sound. Volume control: MAX. Squelch control: CCW	1) Defective speaker or EXT. SPKR jack: Replace the defective parts. 2) Defective audio amplifier IC9 and/or associated circuit components: Replace the defective components. 3) Defective IF amplifier IC101 and/or associated circuit components: Replace the defective components. 4) Defective functional squelch control and/or associated circuit components: Replace the defective components. 5) Defective Q19, IC1 and/or associated circuit: Replace the defective parts.
3) Sound comes out but display does not light. Volume control: MAX. Squelch control: CCW.	1) Defective LCD or rubber connector: Replace the defective parts. 2) Defective IC1 and/or associated circuit: Replace the defective parts.
4) Does not scan and squelch does not operate.	1) Defective IC101 and/or associated circuit components: Replace the defective components. 2) Defective IC1 and/or associated circuit components: Replace the defective components.
5) Does not scan but squelch operates.	1) Defective IC1 and/or associated circuit components: Replace the defective components.
6) Displays incorrectly and/or unable to enter correctly when RESET switch is pushed.	1) Defective Keyboard and/or associated circuit: Replace the defective parts. 2) Defective CPU (IC1) and/or associated circuit: Replace the defective parts.
7) Displays correctly at the time of programming. But after scanning, it becomes faulty.	1) Defective CPU (IC1) and/or associated circuit: Replace the defective parts.
8) MANUAL select operates but SCAN does not operate.	1) Squelch control is not adjusted right: Turn squelch control clockwise.
9) All bands do not operate but display is OK.	1) Faulty connection between linear and logic PCBs: Replace the defective parts. 2) Defective Q15~18 in low-pass filter: Replace the defective parts. 3) Defective IC7, 8 and/or associated circuit: Replace the defective parts. 4) Defective Q1, 2, 5 voltage regulator and/or Q7, 8, D6, 7, 30, 31 DC—DC converter circuit and/or Q3, 6 power saving circuit: Replace the defective parts.

Symptom	Cause/Remedy
10) VHF Lo (Mid) band does not operate but Air, VHF Hi, UHF Lo and UHF Hi band operate.	1) Defective D101~104, T101, 102 Tuning circuit and/or Q114 VCO circuit: Replace the defective parts. 2) Defective Q10 and/or associated circuit: Replace the defective parts.
11) Aircraft band does not operate but VHF Lo, VHF Hi, UHF Lo and UHF Hi band operate.	1) Defective D111 and/or associated circuit: Replace the defective parts. 2) Defective AM IF Amp including Q111, 112: Replace the defective parts. 3) Defective Q11 in band switch circuit: Replace the defective parts.
12) VHF Hi band does not operate but VHF Lo, Air, UHF Lo and UHF Hi band operate.	1) Defective D105, 109, T104, 106 and/or associated circuit: Replace the defective parts. 2) Defective Q12 in band switch circuit: Replace the defective parts.
13) UHF Lo band does not operate but VHF Lo, Air, VHF Hi and UHF Hi band operate.	1) Defective Q104, 105, Q115 and/or associated circuit: Replace the defective parts. 2) Defective Q13 in band switch circuit: Replace the defective parts.
14) UHF Hi band does not operate but VHF Lo, Air, VHF Hi and UHF Lo band operate.	1) Defective Q106–108, 117 and/or associated circuit: Replace the defective parts. 2) Defective Q118 VCO circuit: Replace the defective parts. 3) Defective Q14 and/or associated circuit: Replace the defective parts.
15) Does not make beep tone.	1) Defective Q20 and/or associated circuit: Replace the defective parts. 2) Defective IC1 and/or associated circuit: Replace the defective parts.
16) LOW BATT does not indicate when battery voltage went down.	1) Defective IC4 and/or associated circuit: Replace the defective parts.
17) "Zeromatic" does not operate or holds on a drifted frequency at search operation.	1) Defective IC6, Q9 and DA1 in Zeromatic circuit: Replace the defective parts. 2) Discriminator coil is out of adjustment: TP103 shall have 1/2 Vcc(approx. 2.7 V) in normal receiving mode. 3) Refer to "Reference Frequency OSC Alignment" on page 10.

Important Note:

Pulse, generated while checking circuits and/or certain combinations of key operation may cause improper operation. To clear the malfunction, re-initialization of CPU is necessary: Push RESET switch while pressing **CLEAR**, and then release the RESET switch. All channels (200 ch) will be cleared and frequency indicator displays 000.0000. (Be sure the power is on when doing the above.)

APPENDIX

VHF-MID Band Alignment for 20-9135

Circuit Revision

1. The following parts should be changed as shown below:

Ref. No.	Lo band	Mid band
C103	0.001 μ F	33pF
C107	0.001 μ F	33pF
C191	47pF	3pF
C192	33pF	27pF
C193	33pF	15pF
C194	0.001 μ F	39pF
D119	BB609A	Not used
L101	4LNC-092	4LNC-122
T101	7SSR-278	7SSR-287
T102	7SSR-278	7SSO-281

2. Add D9 and D12, and remove D11.

VCO Alignment

Step 1: Connect a DC SSVM to TP103 and ground.

Step 2: Program CH1, 2 and 3 as follows:

CH1 (68 MHz), CH2 (78 MHz), CH3 (88 MHz)

Step 3: Select channel 3 (88 MHz) and adjust TC103 for 12.0 V on the DC SSVM.

Step 4: Select channel 1 (68 MHz) and adjust T107 for 1.5 V on the DC SSVM.

Step 5: Repeat steps 3 and 4 until no improvement is observed.

The DC SSVM should show as below.

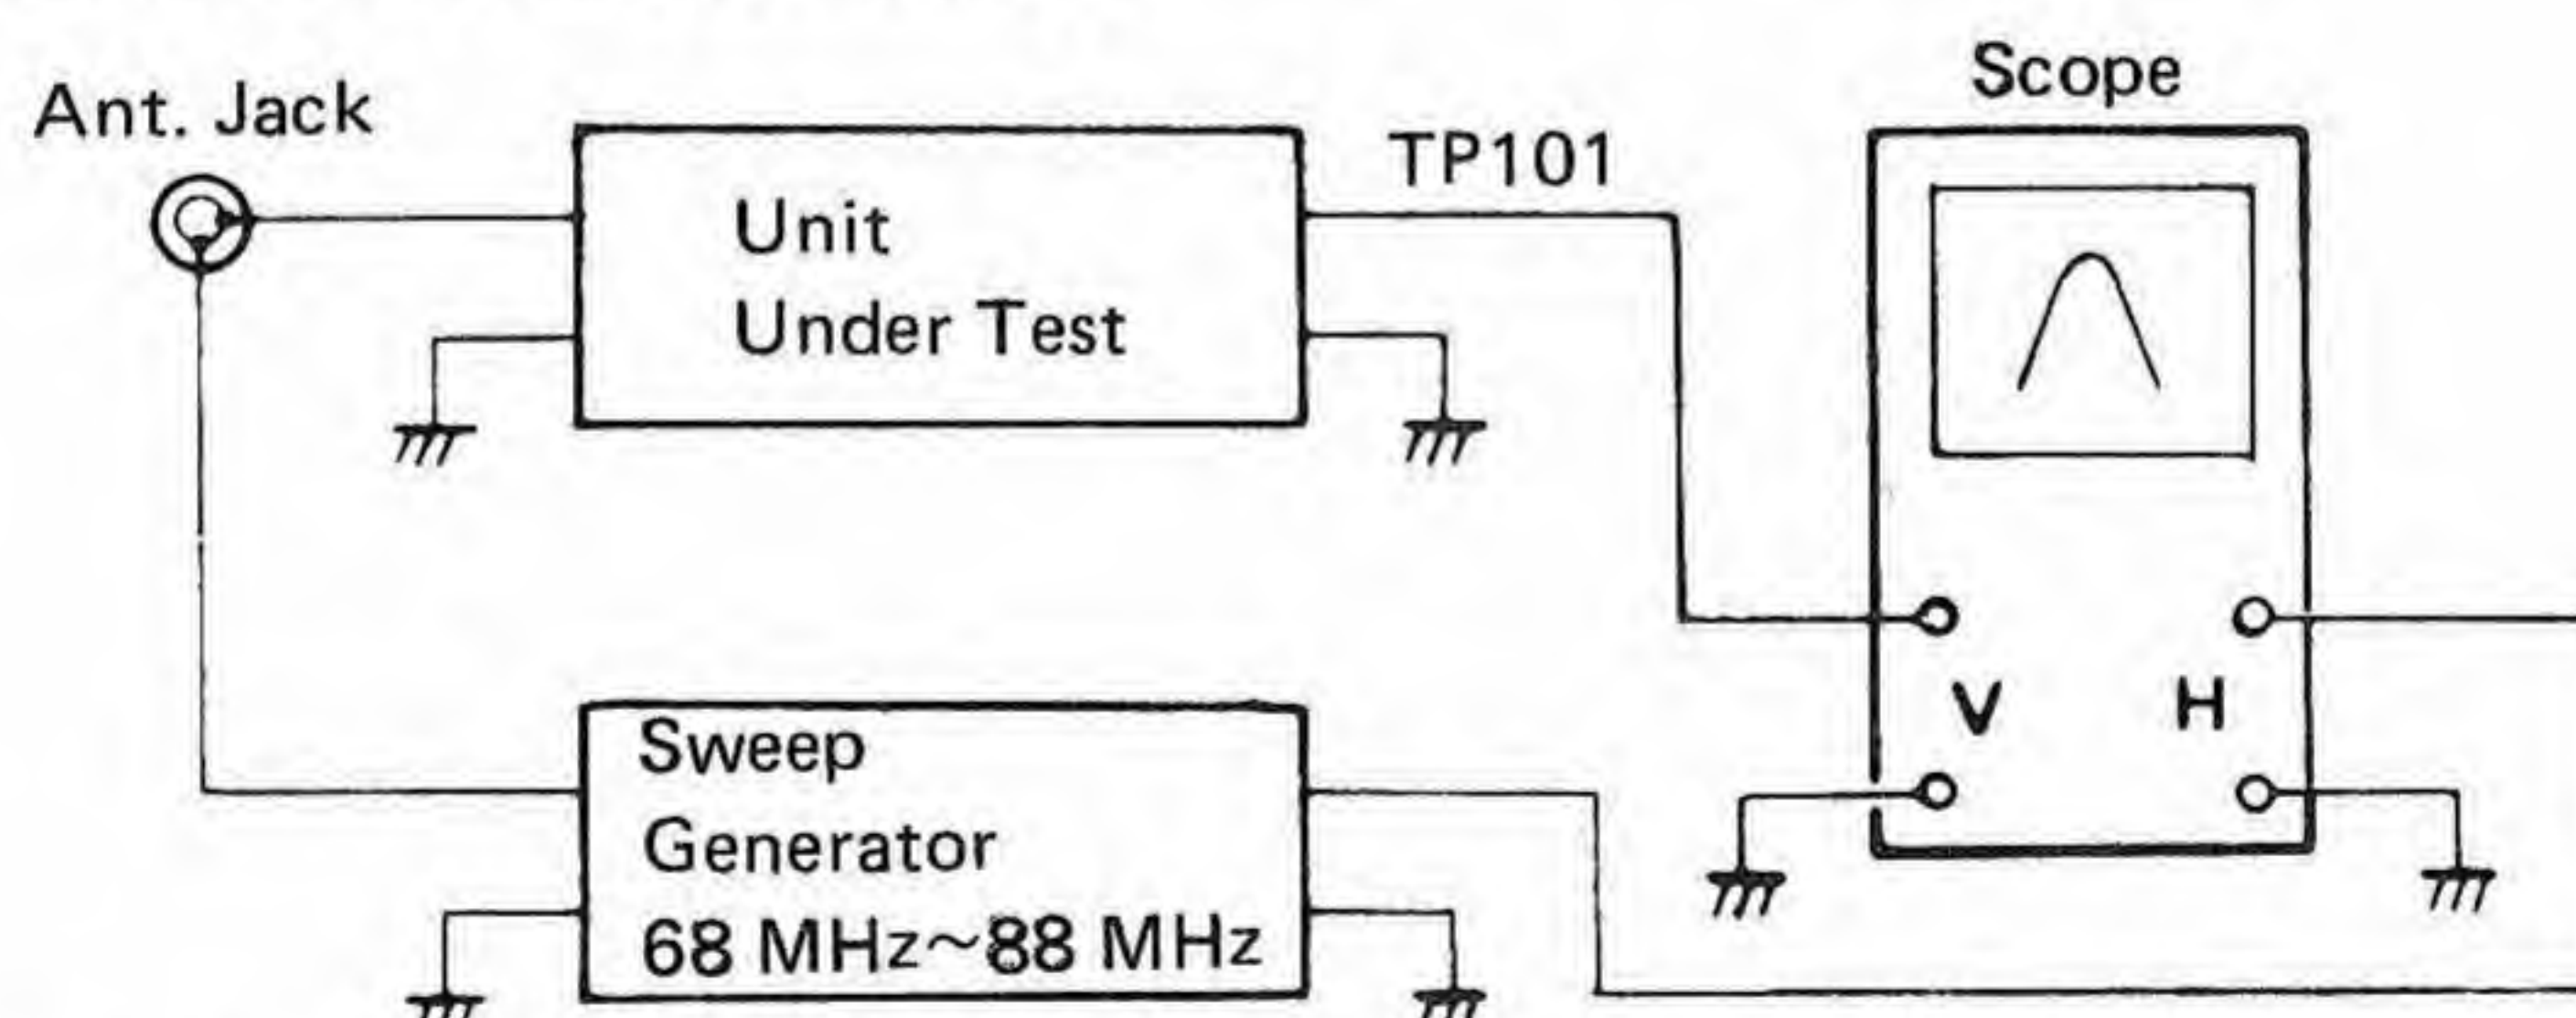

68 MHz Voltage of TP103 1.4-1.6 V

78 MHz Voltage of TP103 6.0-7.0 V

88 MHz Voltage of TP103 11.5-12.5 V

RF Amp Alignment

Step 1: Connect instruments as shown below:

Step 2: Program 68 MHz (CH1), 78 MHz (CH2), 88 MHz (CH3).

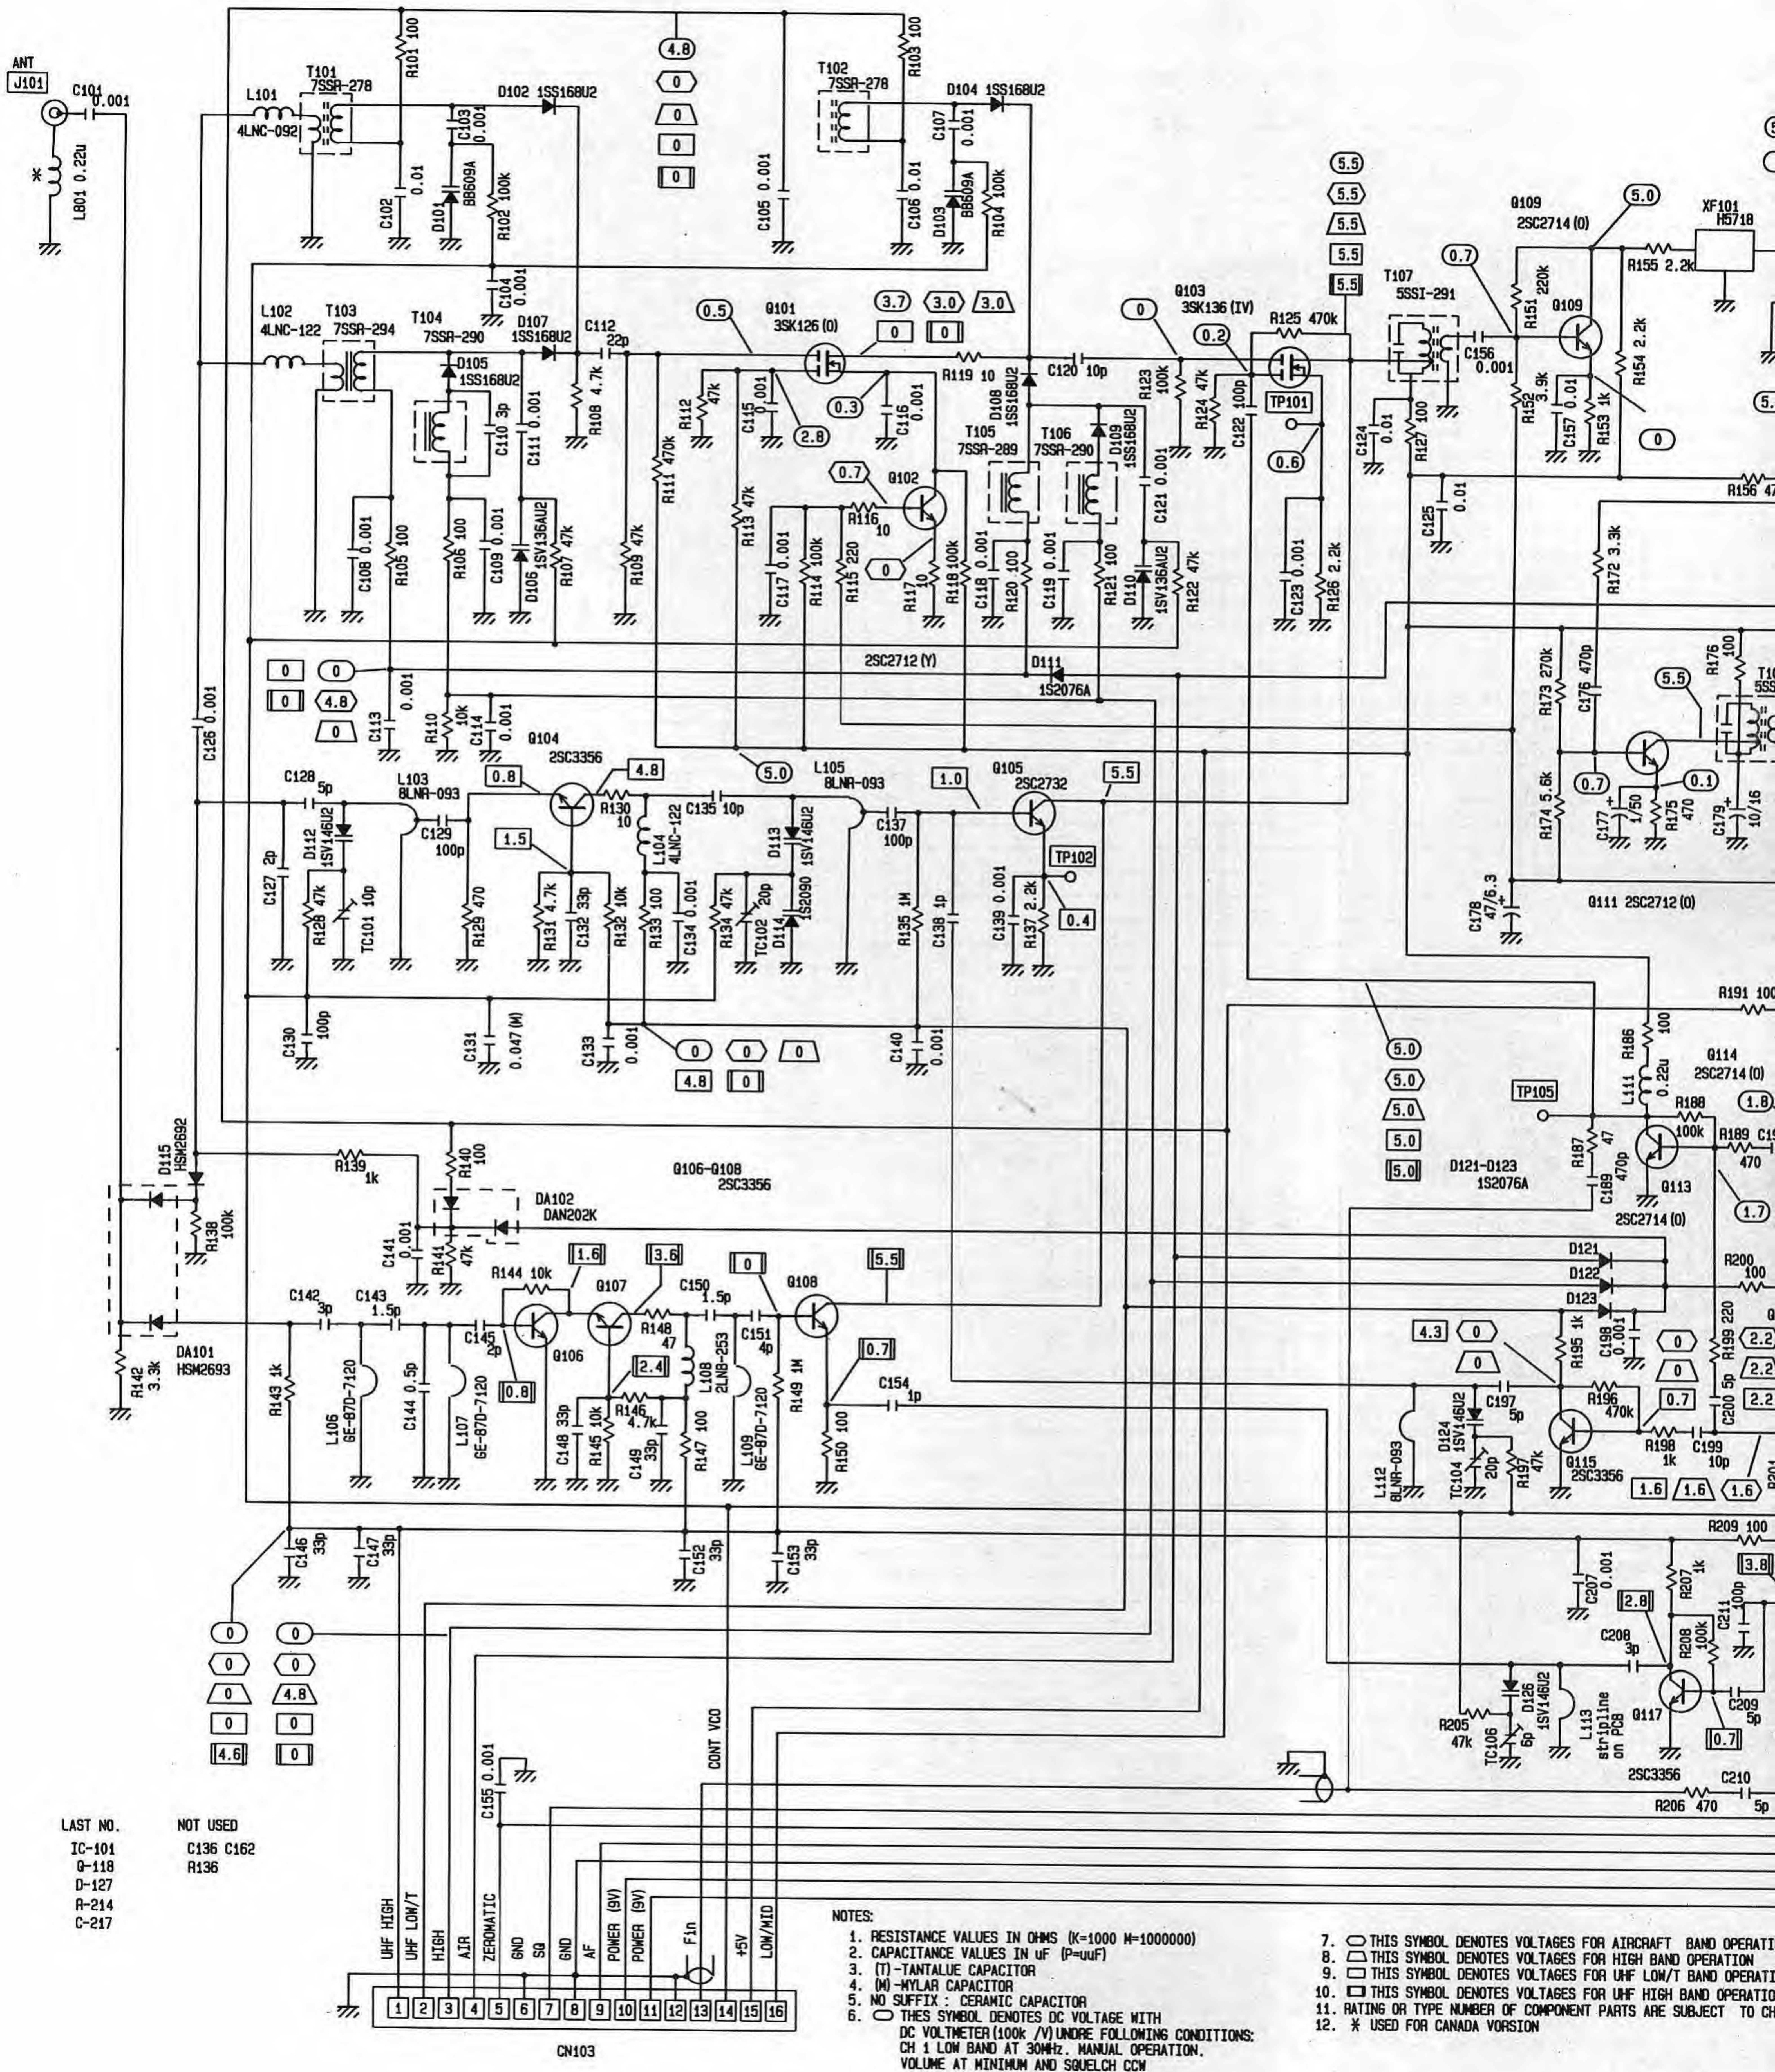

Step 3: Select Channel 1 (68 MHz) and adjust T101 and T102 for maximum RF waveform.

Step 4: Check the Channels 1~3 one by one for maximum RF waveform.

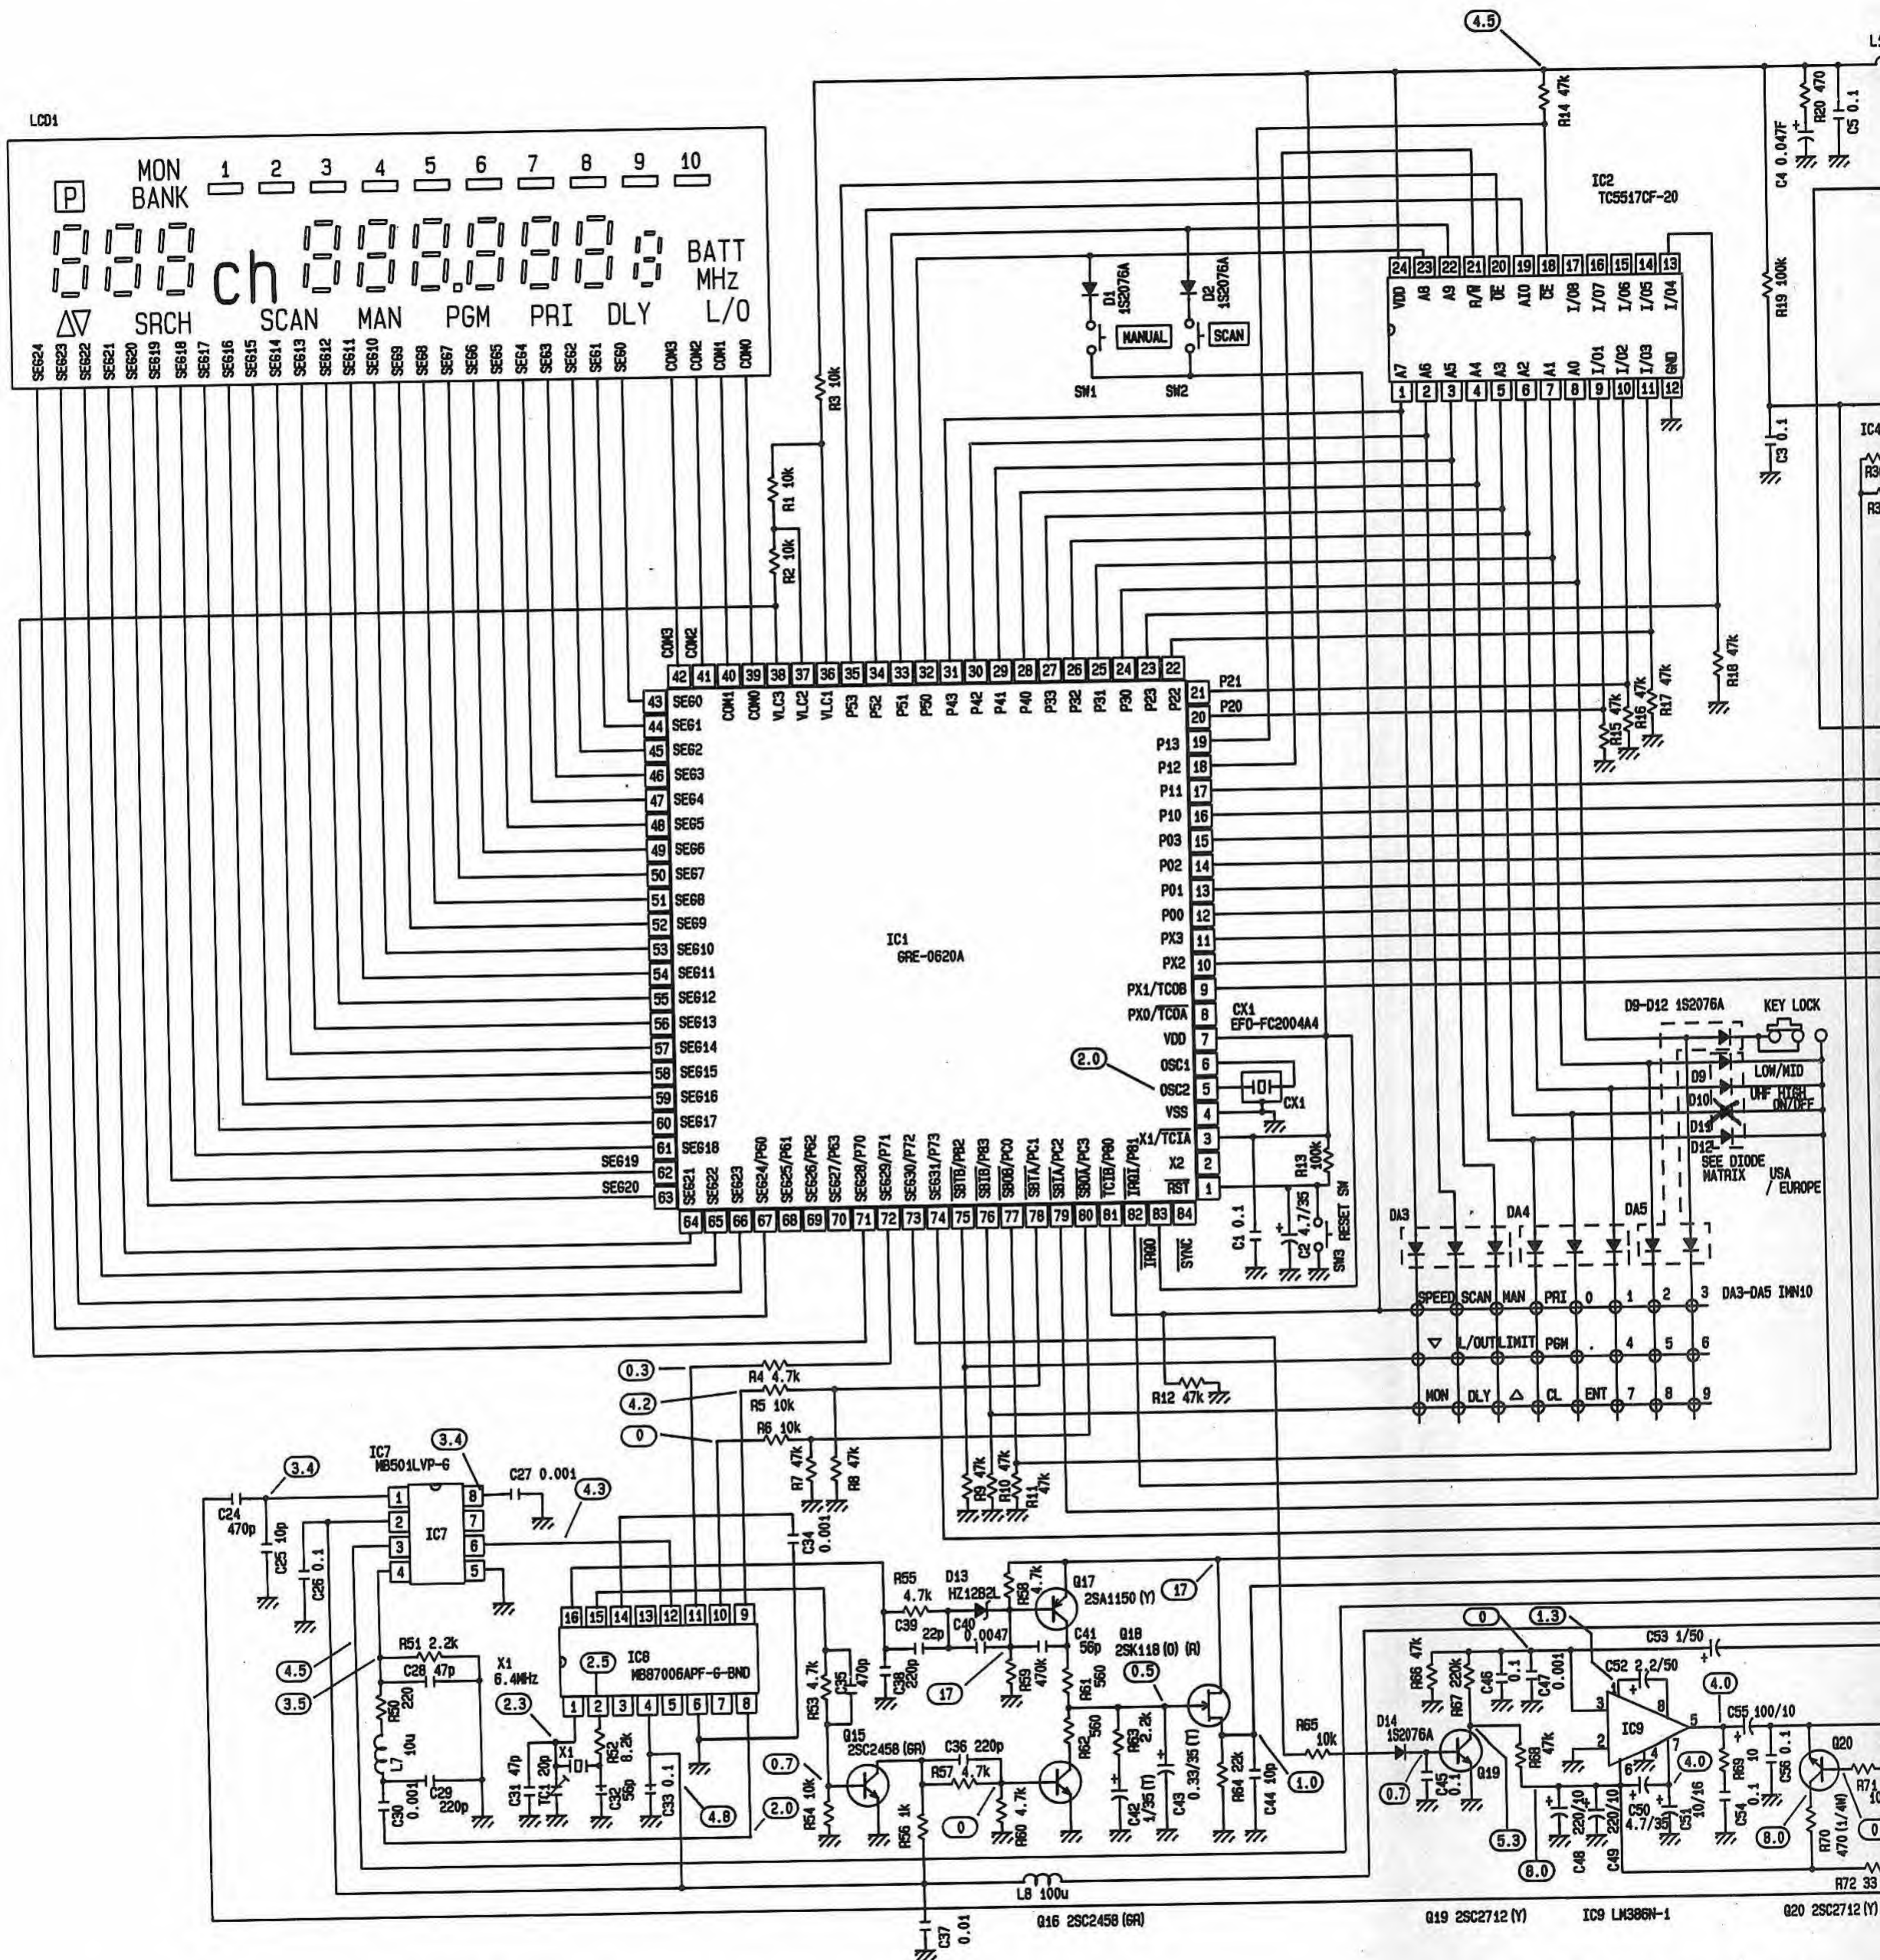

Slight deviation as shown below is acceptable.
